About Enteq Technologies' SABER Tool

The SABER Tool (Steer-At-Bit Enteq Rotary Tool) is a step change in directional drilling technology, developed by Enteq Technologies and based on a concept created by Shell. The ingenuity of the SABER Tool approach lies in the application of proven technologies in novel ways to achieve a sleek, elegant, and mechanically simple design, thereby seeking to improve reliability and project uptime versus traditional rotary steerable systems (RSS).

Rather than using pads or plates for steering, the SABER Tool uses an internally directed pressure differential system across the bit face. Removing these external contact points offers the potential for reduced tool wear and improved reliability, while also achieving true at-bit steering. The sleek, plain collar design also offers the potential for a smoother borehole, further improving reliability, uptime and cost efficiency.

Quoted on the AIM market of the London Stock Exchange (AIM: NTQ.L), Enteq Technologies is a proudly independent UK and Houston-based engineering firm renowned for its high-temperature (HT) expertise that makes the SABER system one of the world's few directional drilling designs intended to be suitable for HT applications. The Company is bringing SABER to commercialisation. For additional information please visit www.enteq.com/products/rotary-steerable-system-srss/
