**Windar Photonics plc**
("Windar Photonics" or the "Company")

**AGM Trading Update**

Windar Photonics plc (AIM: WPHO), the technology group that has developed its WindEye and WindTimizer LiDAR wind sensors and its related 'Nexus' software suite designed to efficiently and cost effectively increase the power output and reduce lifetime operating costs of electricity generating wind turbines, gives an update ahead of the Company's AGM later today.

Windar Photonics provided a trading update, alongside the 2023 final results announcement, on 1st July. Since then, the Company has received a new order from a Canadian client to test our WindEye product on the Senvion turbine platform, starting in September. While the value of this test order, which includes the use of supporting software, is not in itself material, the Board anticipates that if the test is successful, this could lead to potentially significant new orders.

We continue to be in discussions with numerous operators in North America regarding orders for multiple turbine platforms and our view of the order outlook in Japan, Australia and China remains optimistic. The Board looks forward to providing a further update on progress with our interim results in the autumn.
