The information contained within this announcement is deemed by the Company to constitute inside information as stipulated under the Market Abuse Regulations (EU) No. 596/2014 (MAR) as in force in the United Kingdom pursuant to the European Union (Withdrawal) Act 2018. Upon the publication of this announcement via Regulatory Information Service (RIS), this inside information will be in the public domain.

#### Arc Minerals Ltd

# ('Arc' or the 'Company')

#### **Drilling Results Confirm Copper Mineralisation**

Arc Minerals (LSE: ARCM), an exploration company forging partnerships to discover and develop Tier 1 copper deposits, is pleased to announce results from the recently completed drilling programme at its PL135/2017 license that forms part of its Virgo Project within the highly prospective Central Structural Corridor of the Kalahari Copper Belt ('KCB') in the Republic of Botswana.

### Highlights

- First phase drill programme completed with a total of 3,000m drilled
- Copper-Silver Mineralisation Intersected
- Diamond drill hole ALV-DD-004 3m @ 1.29% CuEq within a broader 6m @ 0.82% CuEq
- Geological, Stratigraphic and Structural setting similar to MMG's Zone 5

#### Nick von Schirnding, Executive Chairman of Arc Minerals, commented:

"I am very pleased to report that assay results from the first phase of drilling at our Botswana project identified good copper mineralisation and similar geological settings to neighbouring MMG's Zone 5. These results confirm our view that we have economic grades of copper mineralisation especially in the context of increasing interest by majors in our license. We will continue our drill programme to target the inner copper zone, presenting what we believe to be a further 5km strike along which to drill."

#### Background

The initial aim for the first phase drill campaign was to test for extensions of the mineralisation intersected by MMG in their adjacent license, where 4.3m @ 1.65% CuEq and 6.10m @ 2.56% CuEq were reported in holes HA-1393-D and HA-1394-D (see Figure 1 and Appendix A.).

The Company completed eight holes for 3,000m drilled with diamond drill hole ALV-DD-004 intersecting 3m @1.29% CuEq within a broader 6m @ 0.82% CuEq.Six of the remaining seven holes drilled intersected elevated to anomalous copper mineralisation with initial observations of the core displaying similar geological, stratigraphic and structural settings to that of MMG's operating Zone 5 underground mine.

Further review of the assay data and drill core suggests that the first phase drill programme intersected mineralisation laterally on the fringe of the copper zone, in the iron rich zone, the interpreted outer halo of the main mineralised zone.

All the data is currently being assessed and planning put in place for a second phase drill programme, that will vector away from the iron rich zone, targeting the interpreted inner copper sulphide zone.

Figure 1. Virgo Project License PL 135/2017 First Phase Drill Plan

#### **Qualified Persons**

Mr Vassilios Carellas (BSc (Hons), MAusIMM) is the Chief Operating Officer for Arc Minerals and has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined under the JORC Code (2012). Mr Carellas consents to the inclusion in this announcement of the technical matters based on his information in the form and context in which it appears.

#### **Forward-looking Statements**

This news release contains forward-looking statements that are based on the Company's current expectations and estimates. Forward-looking statements are frequently characterised by words such as "plan", "expect", "project", "intend", "believe", "anticipate", "estimate", "suggest", "indicate" and other similar words or statements that certain events or conditions "may" or "will" occur. Such forward-looking statements involve known and unknown risks, uncertainties and other factors that could cause actual events or results to differ materially from estimated or anticipated events or results implied or expressed in such forward-looking statements. Such factors include, among others: the actual results of current exploration activities; conclusions of economic evaluations; changes in project parameters as plans continue to be refined; possible variations in ore grade or recovery rates; accidents, labour disputes and other risks of the mining industry; delays in obtaining governmental approvals or financing; and fluctuations in metal prices. There may be other factors that cause actions, events or results not to be as anticipated, estimated or intended. Any forward-looking statement speaks only as of the date on which it is made and, except as may be required by applicable securities laws, the Company disclaims any intent or obligation to update any forward-looking statement, whether as a result of new information, future events or results or otherwise. Forward-looking statements are not guarantees of future performance and accordingly undue reliance should not be put on such statements due to the inherent uncertainty therein.

#### **Background on the Virgo Licences**

## Licence PL 135/2017

The Company's prospecting licence PL135/2017 is surrounded on three sides by the prospecting licences of Khoemacau Copper Mining Limited ("Khoemacau"), who have recently been acquired by MMG for c. 1.9 billion.

This licence is located towards the south-eastern margin of the Kalahari Copper Belt occupying a similar geological setting to that recently drilled by Khoemacau at their recent Mawana Fold Discovery and the Zone 9 exploration target, where economic grades of copper mineralisation have already been intersected by drilling. These discoveries are located at the north-western and south-eastern margins of the Company's prospecting licence, respectively.

Khoemacau's Mawana fold discovery has defined a possible economic zone of copper mineralisation that appears to trend towards and into the Company's licence PL 135/2017 (Figure 2.). The Company's recent scout drill holes intersected anomalous grades of copper mineralisation close to this apparent trend and confirmed an east-west trending DKF-NPF contact position approximately 5km long running through the licence.

Figure 2. Image showing Khoemacau licence holding, operations, exploration and expansion projects, in relation to Virgo Licenses.

In November 2021, Arc Minerals Limited acquired a 75% interest in Alvis-Crest (Proprietary) Limited, the holder of two prospecting licences (PL 135/2017 & PL 162/2017) in Botswana's Kalahari Copper Belt ("KCB"), colloquially called the Virgo Project/Licences.Licence PL 135/2017 is approximately 10km south-east of the large underground Khoemacau Copper mine recently commissioned by Cupric Canyon Capital LP.

# A map of the licences is available here: http://www.rns-pdf.londonstockexchange.com/rns/3027T\_1-2021-3-24.pdf

The Virgo Licences cover an area of over 210km<sup>2</sup> and lie within (PL 165/2017) and adjacent (PL 135/2017) to the highly prospective Central Structural Corridor and within 10km and 50km of the Zone 5 and Banana Zone copper projects respectively, known as the two largest copper projects on the KCB.

Historically, two copper-nickel soil anomalies have already been recorded on PL 135/2017 and PL 162/2017 and are approximately 3km and 2.5km in strike length, respectively. The largest of the two anomalies, located on PL 135/2017, overlays an interpreted DKF-NPF contact, while a second, more intermittent, anomaly may be

linked to extensional faulting around the dome edge. The large coherent anomaly on PL 162/2017 also appears to overlay the interpreted DKF-NPF contact on the northern limb of a syncline.

#### **Section 3 Estimation and Reporting of Mineral Resources**

Not Applicable

# Section 4 Estimation and Reporting of Ore Reserves

Not Applicable

"anomaly or anomalous"	something in mineral exploration that geologists interpret as deviating from what is standard, normal, or expected.
"assay"	The laboratory test conducted to determine the proportion of a mineral within a rock or other material. For copper, usually reported as percentage which is equivalent to percentage of the mineral (i.e. copper) per tonne of rock.
"azimuth"	the "compass direction" refers to a geographic bearing or azimuth as measured by a magnetic compass, in true or magnetic north.
"bornite"	Bornite, also known as peacock ore, is a copper sulphide mineral with the formula $Cu_5FeS_4$ .
"breccia"	Breccia is a rock classification, comprises millimetre to metre-scale rock fragments cemented together in a matrix, there are many sub- classifications of breccias.
"chalcocite"	Chalcocite is a copper sulphide mineral with the formula $\mathrm{Cu}_2\mathrm{S}$ and is
	an important copper ore mineral. It is opaque and dark-grey to black with a metallic lustre.
"chalcopyrite"	Chalcopyrite is a copper sulphide mineral with formula $CuFeS_{\!2}.$ It
	has a brassy to golden yellow colour.
"chargeability"	Chargeability is a physical property related to conductivity. Chargeability is used to characterise the formation and strength of the induced polarisation within a rock, under the influence of an electric field, suggesting sulphide mineralisation at depth.
"covellite"	Covellite is a copper sulphide mineral with the formula CuS. This indigo blue mineral is ubiquitous in some copper ores.
"diamond drilling"	A drilling method in which penetration is achieved through abrasive cutting by rotation of a diamond encrusted drill bit. This drilling method enables collection of tubes of intact rock (core) and when successful gives the best possible quality samples for description, sampling and analysis of an ore body or mineralised structure.
"dip"	A line directed down the steepest axis of a planar structure including a planar ore body or zone of mineralisation. The dip has a measurable direction and inclination from horizontal.
"geochemical"	Refers to geological information using measurements derived from chemical analysis
"geophysical"	Refers to geological information using unit measurements derived from the use of magnetic and electrical readings
"geophysical techniques"	include the exploration of an area by exploiting differences in physical properties of different rock types. Geophysical methods include seismic, magnetic, gravity, induced polarisation and other techniques; geophysical surveys can be undertaken from the ground or from the air
"gossan"	is an iron-bearing weathered product that usually overlies a sulphide deposit
"grab sample"	are samples of rock material collected from a small area, often just a few pieces or even a single piece of rock "grabbed" from a face, dump or outcrop or roughly 2-5kg. These are common types of rock samples collected when conducting mineral exploration. The sample usually consists of material that is taken to be

# Appendix B - Glossary of Technical Terms

	representative of a specific type of rock or mineralisation.
"grade"	The proportion of a mineral within a rock or other material. For
	copper mineralisation this is usually reported as % of copper per
	tonne of rock.
"g/t"	grams per tonne; equivalent to parts per million ('ppm')
"hematite"	Hematite is the mineral form of iron(III) oxide ( $Fe_2O_3$ ), one of
	several iron oxides. Magnetite alteration is also typically associate
	with porphyry copper systems, at or close to the central core.
"Indicated Resource"	An "Indicated Mineral Resource" is that part of a Mineral Resource
	for which quantity, grade or quality, densities, shape and physical
	characteristics, can be estimated with a level of confidence
	sufficient to allow the appropriate application of technical and
	economic parameters, to support mine planning and evaluation of
	the economic viability of the deposit. The estimate is based on
	detailed and reliable exploration and testing information gathered
	through appropriate techniques from locations such as outcrops,
	trenches, pits, workings and drill holes that are spaced closely
	enough for geological and grade continuity to be reasonably
	assumed.
"Inferred Resource"	An "Inferred Mineral Resource" is that part of a Mineral Resource
	for which quantity and grade or quality can be estimated on the
	basis of geological evidence and limited sampling and reasonably
	assumed, but not vermed, geological and grade continuity. The
	through appropriate techniques from locations such as outerons
	trenches nits workings and drill holes
"Induced Polarisation	Induced polarisation (IP) is a geophysical survey used to identify
Geophysics"	the electrical chargeability of subsurface materials such as
deophysics	sulphides The survey involves an electric current that is
	transmitted into the subsurface through two electrodes, and
	voltage is monitored through two other electrodes.
"intercept"	Refers to a sample or sequence of samples taken across the entire
	width or an ore body or mineralised zone. The intercept is
	described by the entire thickness and the average grade of
	mineralisation.
"JORC Code"	The Australasian Code for Reporting of Exploration Results, Mineral
	Resources and Ore Reserves ('the JORC Code') is a professional code
	of practice that sets minimum standards for Public Reporting of
	minerals Exploration Results, Mineral Resources and Ore Reserves.
"К"	The element potassium, abundance on surface can be inferred from
	radiometric surveys
"Magnetics"	Rocks are made up of different minerals and the magnetic
	properties of a rock depends on the amount and type of iron rich
	minerals it contains. Earth's magnetic field interacts with these iron
	rich minerals to generate variations in the magnetic field.
	Measuring and mapping these variations allows remotely mapping
	of the distribution and patterns of magnetic rocks and, as a result,
	map the subsurface geology
"magnetite"	Magnetite is main iron ore mineral, with chemical formula $Fe_3O_4$ .
	Magnetite is ferromagnetic, and it is attracted to a magnet and can
	be magnetized to become a permanent magnet itself.
"massive"	In a geological sense, refers to a zone of mineralisation that is
	dominated by sulphide minerals. The sulphide-mineral-rich
	material can occur in centimetre-scale, metre-scale or in tens of
	ineres wide venis, ienses or sneet-like bodies containing
"Measured Deseures"	spharente, garena, and / or charcopyrite etc.
Measured Resource	for which quantity grade or quality densities shape, and physical
	characteristics are so well established that they can be estimated
	with confidence sufficient to allow the appropriate application of
	technical and economic parameters, to support production planning
	and evaluation of the economic viability of the deposit. The
	estimate is based on detailed and reliable exploration, sampling
	and testing information gathered through appropriate techniques
	from locations such as outcrops, trenches, pits, workings and drill
	holes that are spaced closely enough to confirm both geological and
	grade continuity.
"Mineral Resource"	A "Mineral Resource" is a concentration or occurrence of diamonds,
	natural solid inorganic material, or natural solid fossilised organic
	material including base and precious metals, coal, and industrial
	minerals in or on the Earth's crust in such form and quantity and of
l	I such a grade or quality that it has reasonable prospects for

1	Jouon a brade of quality that it has reasonable prospects for
	economic extraction. The location, quantity, grade, geological
	characteristics and continuity of a Mineral Resource are known,
	estimated or interpreted from specific geological evidence and
	knowledge.
"mineralisation"	In geology mineralisation is the denosition of economically
	important matche (conner sold load vin ate) that in some conservation
	Important metals (copper, gold, lead, zin etc) that in some cases can
	be in sufficient quantity to form mineral ore bodies.
"open pit mining"	A method of extracting minerals from the earth by excavating
	downwards from the surface such that the ore is extracted in the
	open air (as opposed to underground mining).
"outcrop"	A section of a rock formation or mineral vein that appears at the
	surface of the earth. Geologists take direct observations and
	samples from outcrons used in geologic analysis and creating
	geologic mans. In situ (in place) measurements are critical for
	geologic maps. In situ (in place) measurements are critical for
	proper analysis of the geology and mineralisation of the area under
	investigation.
"polymict"	A geology term, often applied to breccias or conglomerates, which
	identifies the composition as consisting of fragments of several
	different rock types.
"Preliminary Economic	NI 43-101 defines a PEA as "a study other than a pre-feasibility
Assossment"	study or fossibility study, which includes an economic analysis of
Assessment	study of reasibility study, which includes an economic analysis of
	the potential viability of mineral resources .
"Pyrrhotite"	Pyrrhotite is an <u>iron sulphide mineral</u> with the formula $Fe(1-x)S(x =$
	0 to 0.2). It is a <u>nonstoichiometric</u> variant of FeS, the mineral known
	as <u>troilite</u> . Pyrrhotite is also called magnetic <u>pyrite</u>
"Radiometrics"	The radiometric, or gamma-ray spectrometric method is a
	geophysical process used to estimate concentrations of the
	radioelements notassium uranium and thorium by measuring the
	radiocicinents potassium, dramam and thorium by measuring the
	commo rous which the radioactive isotones of these elements emit
	gamma-rays which the radioactive isotopes of these elements emit
	gamma-rays which the radioactive isotopes of these elements emit during radioactive decay
"sediments"	gamma-rays which the radioactive isotopes of these elements emit during radioactive decay Sedimentary rocks formed by the accumulation of sediments. There
"sediments"	gamma-rays which the radioactive isotopes of these elements emit during radioactive decay Sedimentary rocks formed by the accumulation of sediments. There are three types, Clastic, Chemical and Organic sedimentary rocks.
"sediments" "sphalerite"	gamma-rays which the radioactive isotopes of these elements emit during radioactive decay Sedimentary rocks formed by the accumulation of sediments. There are three types, Clastic, Chemical and Organic sedimentary rocks. Sphalerite is a zinc sulphide in crystalline form but almost always
"sediments" "sphalerite"	gamma-rays which the radioactive isotopes of these elements emit during radioactive decay Sedimentary rocks formed by the accumulation of sediments. There are three types, Clastic, Chemical and Organic sedimentary rocks. Sphalerite is a zinc sulphide in crystalline form but almost always contains variable iron, with formula (Zn,Fe)S. It can have a
"sediments" "sphalerite"	gamma-rays which the radioactive isotopes of these elements emit during radioactive decay Sedimentary rocks formed by the accumulation of sediments. There are three types, Clastic, Chemical and Organic sedimentary rocks. Sphalerite is a zinc sulphide in crystalline form but almost always contains variable iron, with formula (Zn,Fe)S. It can have a vellowish to honey brown or black colour.
"sediments" "sphalerite"	gamma-rays which the radioactive isotopes of these elements emit during radioactive decay Sedimentary rocks formed by the accumulation of sediments. There are three types, Clastic, Chemical and Organic sedimentary rocks. Sphalerite is a zinc sulphide in crystalline form but almost always contains variable iron, with formula (Zn,Fe)S. It can have a yellowish to honey brown or black colour.
"sediments" "sphalerite" "supergene"	gamma-rays which the radioactive isotopes of these elements emit during radioactive decay Sedimentary rocks formed by the accumulation of sediments. There are three types, Clastic, Chemical and Organic sedimentary rocks. Sphalerite is a zinc sulphide in crystalline form but almost always contains variable iron, with formula (Zn,Fe)S. It can have a yellowish to honey brown or black colour. Supergene ore processes occur near surface, and form deposits of
"sediments" "sphalerite" "supergene"	gamma-rays which the radioactive isotopes of these elements emit during radioactive decay Sedimentary rocks formed by the accumulation of sediments.
