About the Hazen Project

The Hazen Project is currently under option for sale to a large US-based company which may purchase the project for the sum of US 800,000.

The Company's mining claims cover a deposit of glassy pumice targeted as a natural pozzolan. Pumice is currently mined elsewhere in the US as natural pozzolan and at Hazen it was mined as a lightweight aggregate from a shallow open pit some decades ago.

The markets for natural pozzolan, as a replacement for cement and fly ash in concrete, are regional and reflect the distribution of the main areas of high population density where concrete demand is highest.

The Hazen pozzolan deposit is just 9km from a rail siding on the arterial east-west Union Pacific line and is therefore well positioned for rail transport to the regional markets of northern California, points east, as well as the local markets around Reno and northern Nevada.

The Company's laboratory testwork to date has shown that the material present in the pit exceeds the specifications of ASTM standard C618 for natural pozzolan. The Hazen pumice has the additional property that it is lightweight and has potential as a lightweight aggregate for use in lightweight concrete blocks and facing stones.
